

Future Teak®: Future tradition

Realizing the ever increasing need for technical and cost effective improvements for the cruise ship industry Bolidt has just introduced a new deck covering product at the recent SMM and Seatrade exhibitions which is set to revolutionise the future of ship deck covering.

As a developer, manufacturer and installer of synthetic systems in the most demanding of environments for the past 40 years and as a major supplier to the cruise industry for the past 20, Bolidt, with the introduction of FutureTeak®, feels uniquely positioned to meet the challenges placed on the modern decking system in both the new-build and the operating environments for the next generation.

Future Teak® the breakthrough!

- Realistic: the “look” and “feel” of traditional teak decks.
- Ecologically responsible.
- Reduced installation time.
- Durable, lightweight and extremely cost effective.
- Safe in both wet and dry. FutureTeak® relies on Micro traction® through and through and not unreliable surface anti-slip sealants.
- Lifetime corrosion protection. Guaranteed.
- Since all maintenance can be done at sea with minimum passenger inconvenience large areas of deck which may be required for other projects during refits are not tied-up and do not require expensive tenting.
- Compatible with all existing Bolideck® systems. It can be customized as required to accommodate modern design requirements, sports and jogging decks.

Available for new-build or as an upgrade for existing Bolidt or other-brand deck coverings. Realistically speaking ...the only realistic alternative!
